) should be able to unlock without errors, because then unlocking will not set the chain and the user will be able to activate WPA2 using an ASCII passphrase with "network://" URI. I used these commands on my first (unused) 8.04 install: sudo apt-get install wpasupplicant pptp-linux sudo apt-get install wpa_supplicant sudo apt-get remove wpa_supplicant sudo apt-get purge wpasupplicant I have also tried this: sudo apt-get remove wpasupplicant pptp-linux But I can't find wpa_supplicant (and pptp-linux) in synaptic (or apt-cache search). Note: I couldn't find the correct package name, so I followed some instructions to install wpa_supplicant without network-manager, but it didn't work, it installed a wpa_supplicant and wpa_cli (that didn't work, because it's not the package I wanted). I also tried to install wpa_supplicant and pptp-linux without network-manager (by removing the repositories), but I had to get more informations from their website. A: 1) sudo apt-get remove wpasupplicant pptp-linux 2) sudo apt-get purge wpasupplicant pptp-linux 3) sudo apt-get install wpasupplicant pptp-linux 4) sudo apt-get remove wpa_supplicant 5) sudo apt-get purge wpa_supplicant 6) sudo apt-get install wpa_supplicant Try sudo apt-get install wpasupplicant The output of that command will show you all the packages that will be installed. Then, go to synaptic and search for "wpa". From here: WPA/WPA2 Enterprise (wpa_supplicant) 1.4.0 82157476af
